

# Analyzing structural variation in breast cancer with long read sequencing of patient-derived organoids

Rachel M Sherman

Johns Hopkins University

Schatz and Salzberg Labs

Biological Data Science 2018

# Structural variation characterizes cancer

## Prognostic indicator

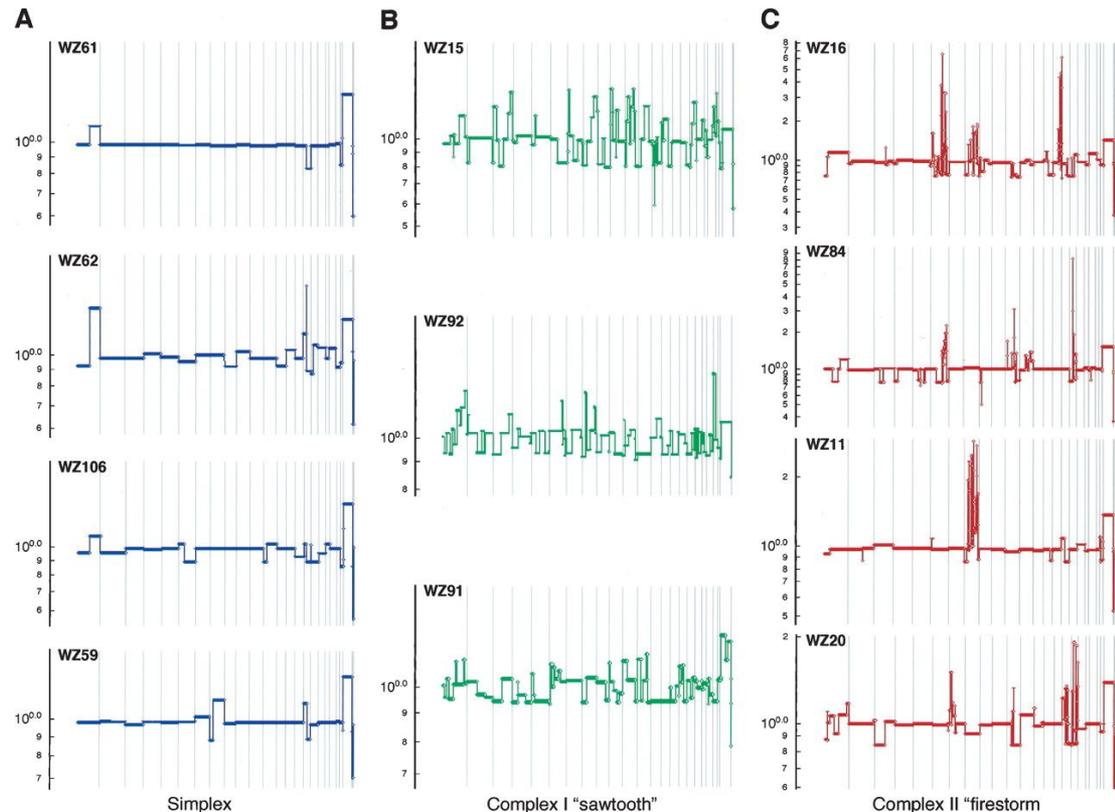

Greater instability leads to worse patient outcomes

## Copy number changes

Amplifications and deletions, especially of oncogenes and tumor suppressors

## Gene fusions

Can drastically alter gene expression levels

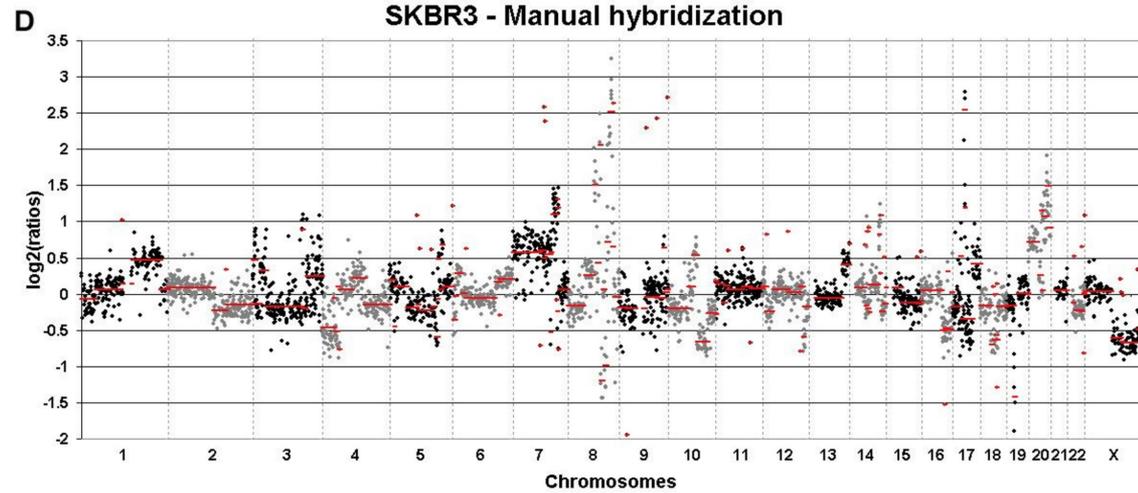

**Figure 2.** Major types of tumor genomic profiles. Segmentation profiles for individual tumors representing each category: (A) simplex; (B) complex type I or sawtooth; (C) complex type II or firestorm. Scored events consist of a minimum of six consecutive probes in the same state. The y-axis displays the geometric mean value of two experiments on a log scale. Note that the scale of the amplifications in C is compressed relative to A and B owing to the high levels of amplification in firestorms. Chromosomes 1–22 plus X and Y are displayed in order from left to right according to probe position.

(Hicks *et al*, 2006, Genome Research)

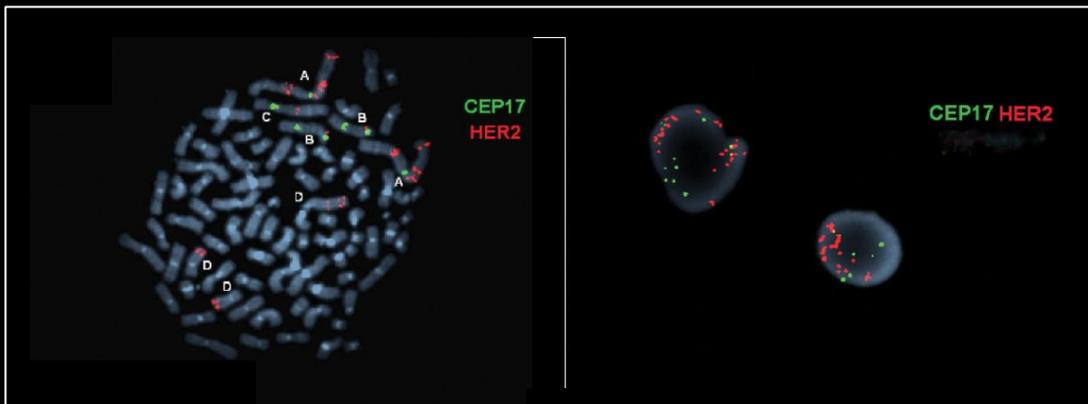

# SK-BR-3 Her2 amplified cell line

Derived in 1970, most commonly used Her2 amplified cell line

FISH, aCGH, and karyotyping show large-scale changes

Joose, Beers, & Nederlof, 2007

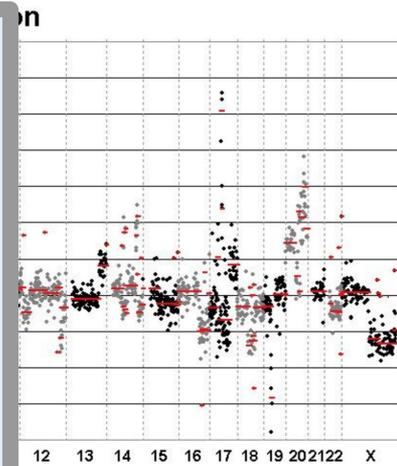

Mosoyan *et al*, 2013

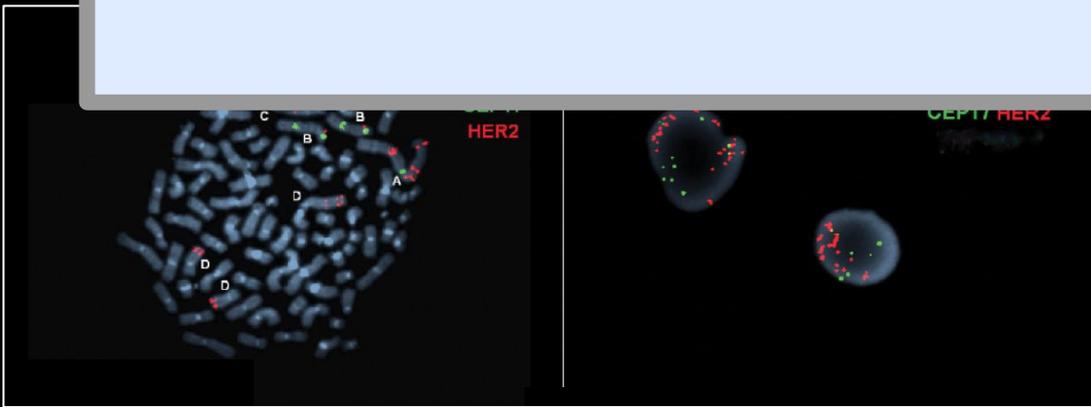

Davidson *et al*, 2000

# SK-BR-3 Her2 amplified cell line

Despite importance of structural variation, relatively little is known except large copy number variants

Beers, & Nederlof, 2007

Mosoyan *et al*, 2013

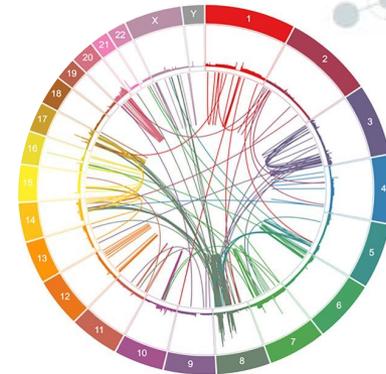

Davidson *et al*, 2000

# Analyzing variation with long reads

## Part 1 (SK-BR-3)

How prevalent are mid-sized variants?

How necessary are long reads?

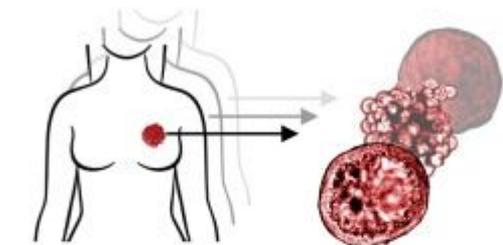

(Nattestad *et al*, 2018)

## Part 2 (Patient-derived organoids)

What new variants have we found?

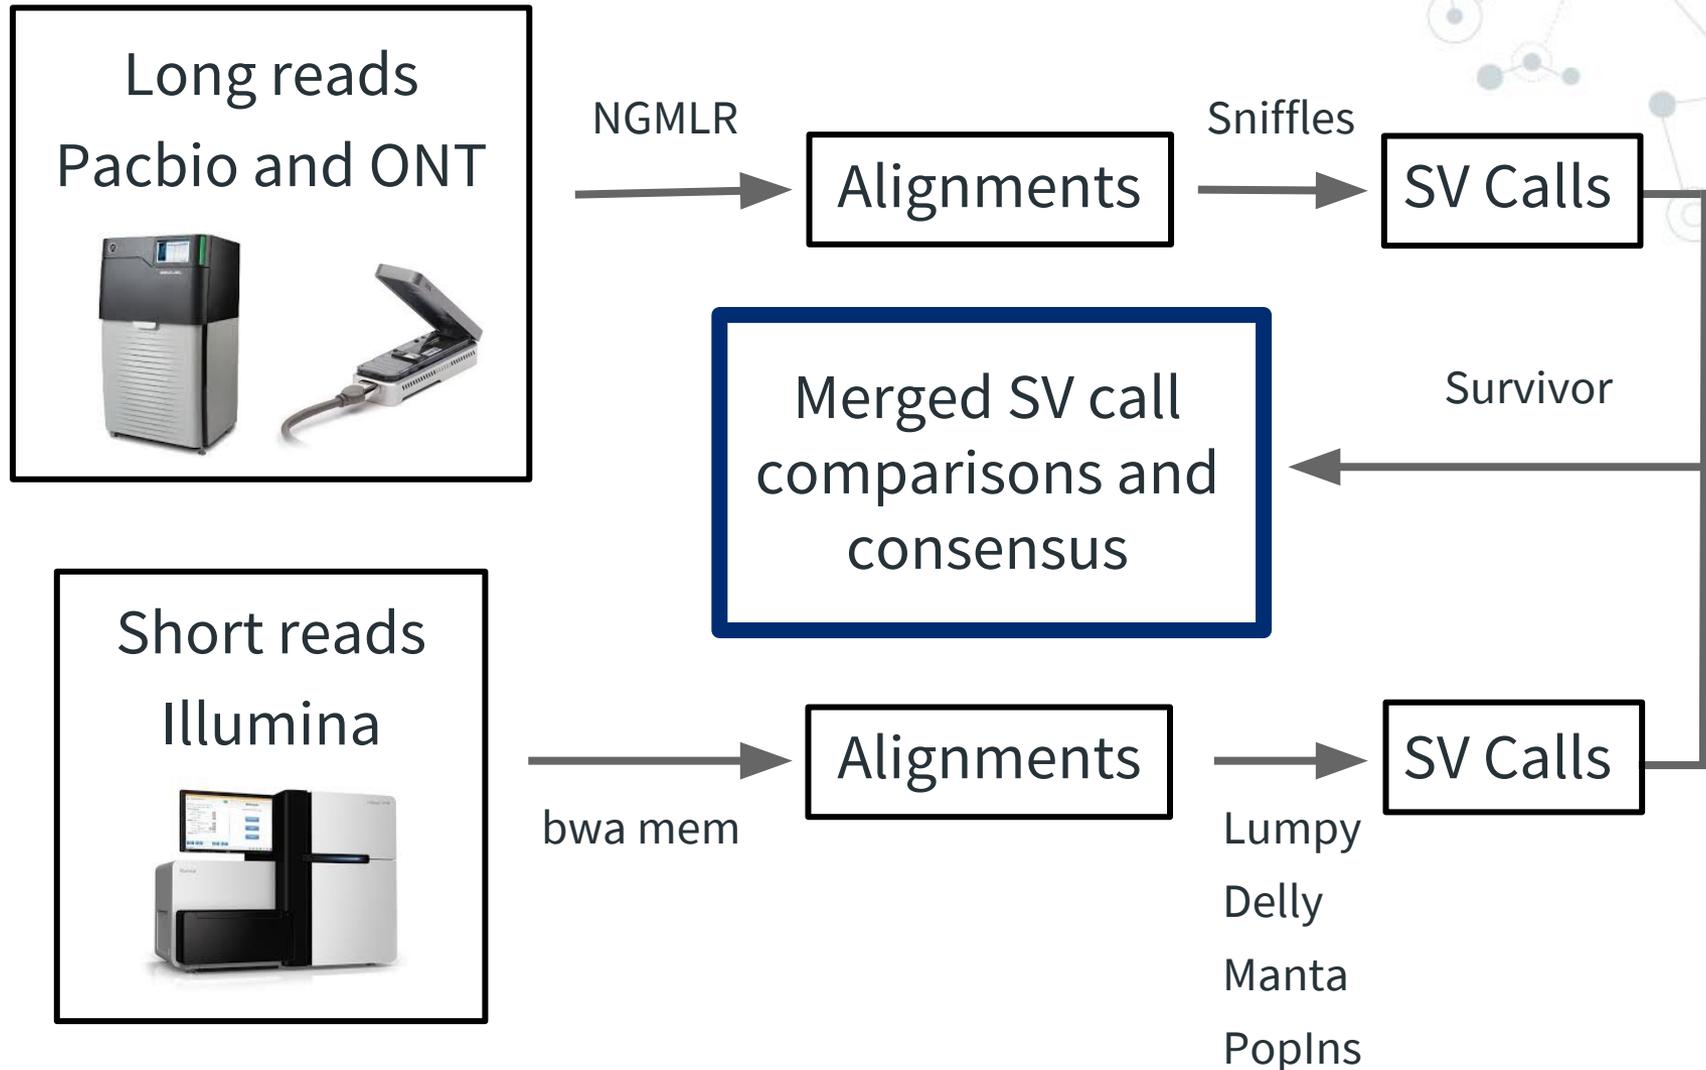

How do they compare to a cell line (SK-BR-3)?

What else can long reads tell us?

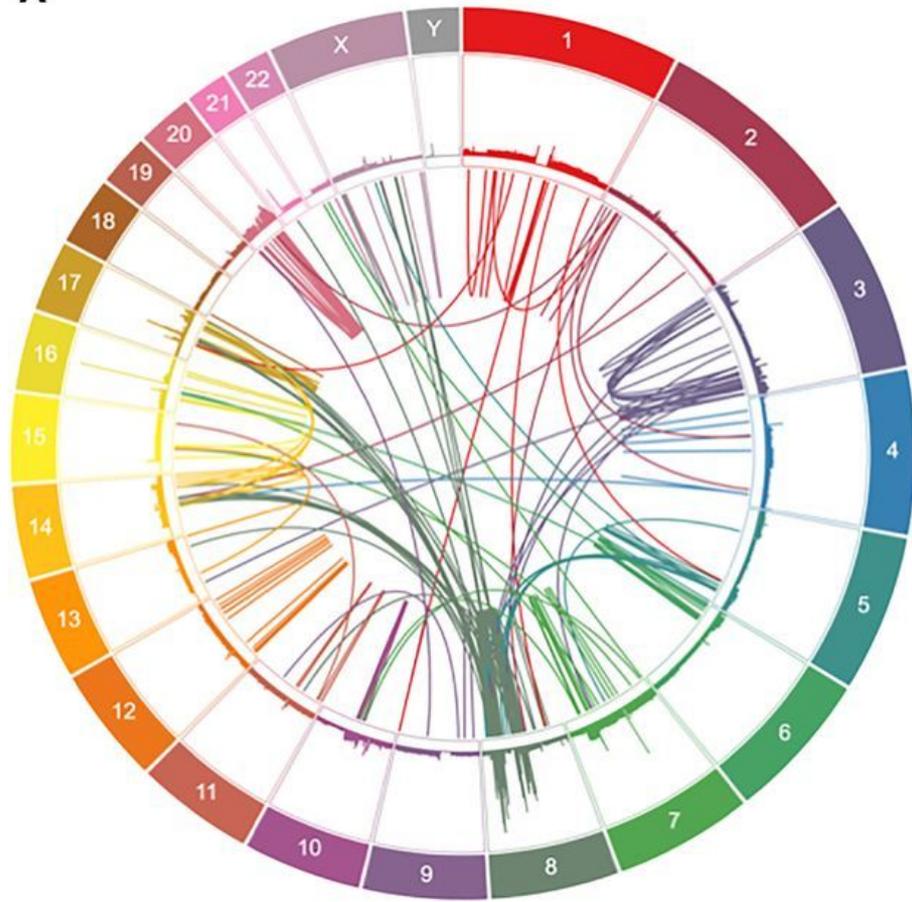

(Sachs *et al*, 2017)

# SK-BR-3 sequencing and analysis

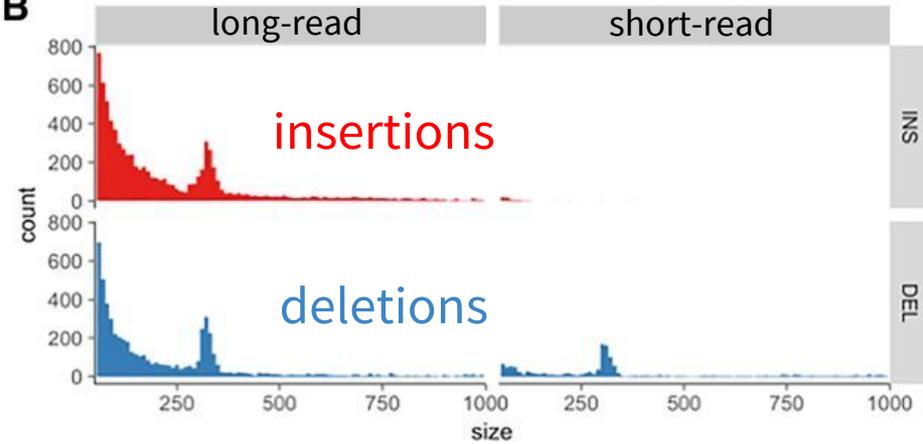

## Inter-chromosomal or over 10 kb

**A**

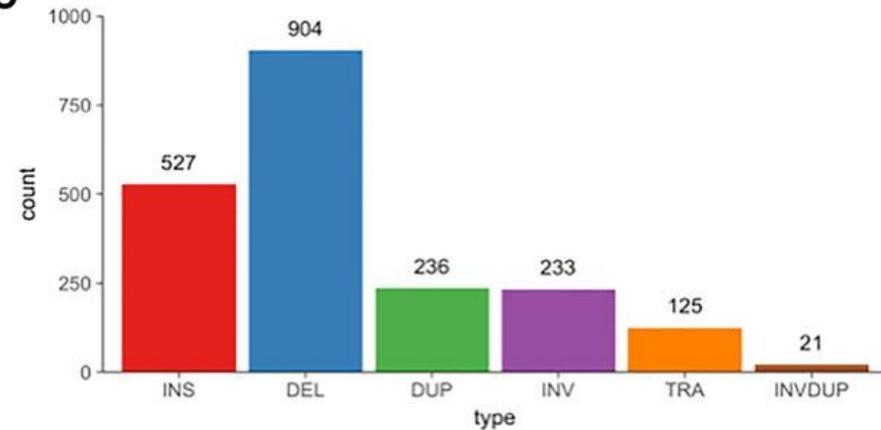

## 50 bp to 1 kb insertions and deletions

**B**

## Variant counts over 1 kb

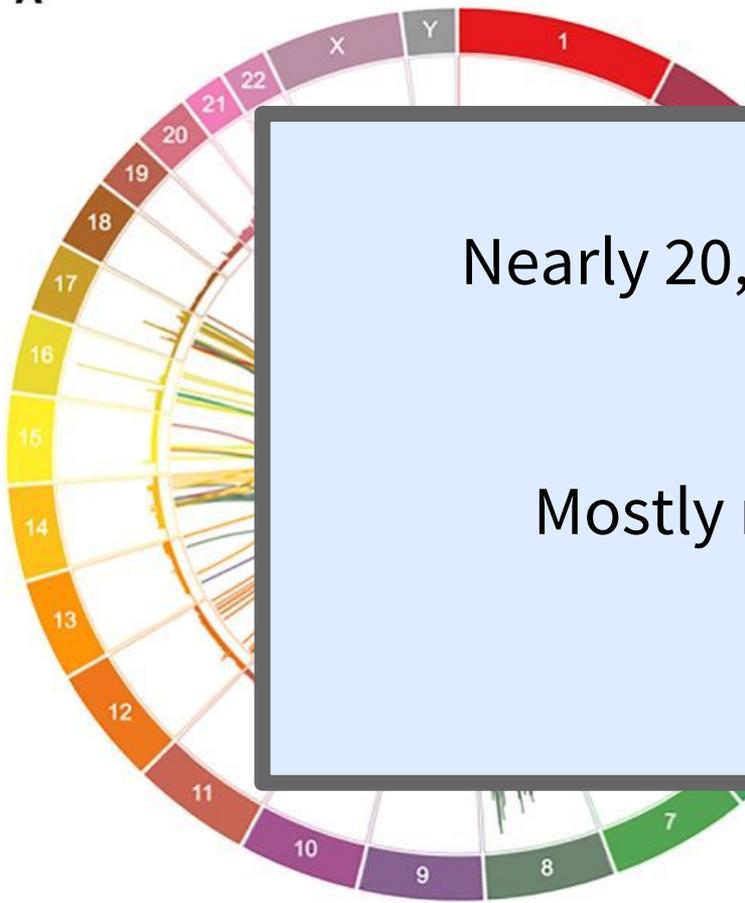

**C**

Structural variants detected with PacBio in SKBR3 (Nattestad *et al*, 2018).

Inter-chromosomal or over 10 kb

A

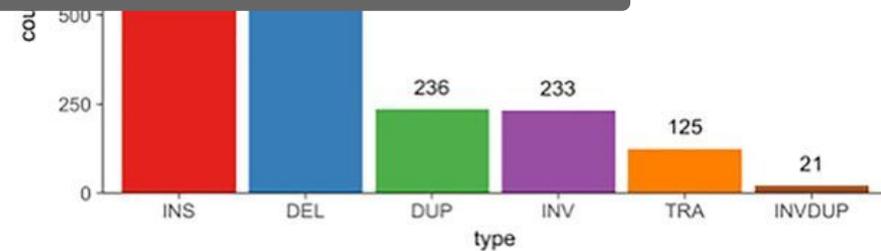

50 bp to 1 kb insertions and deletions

B

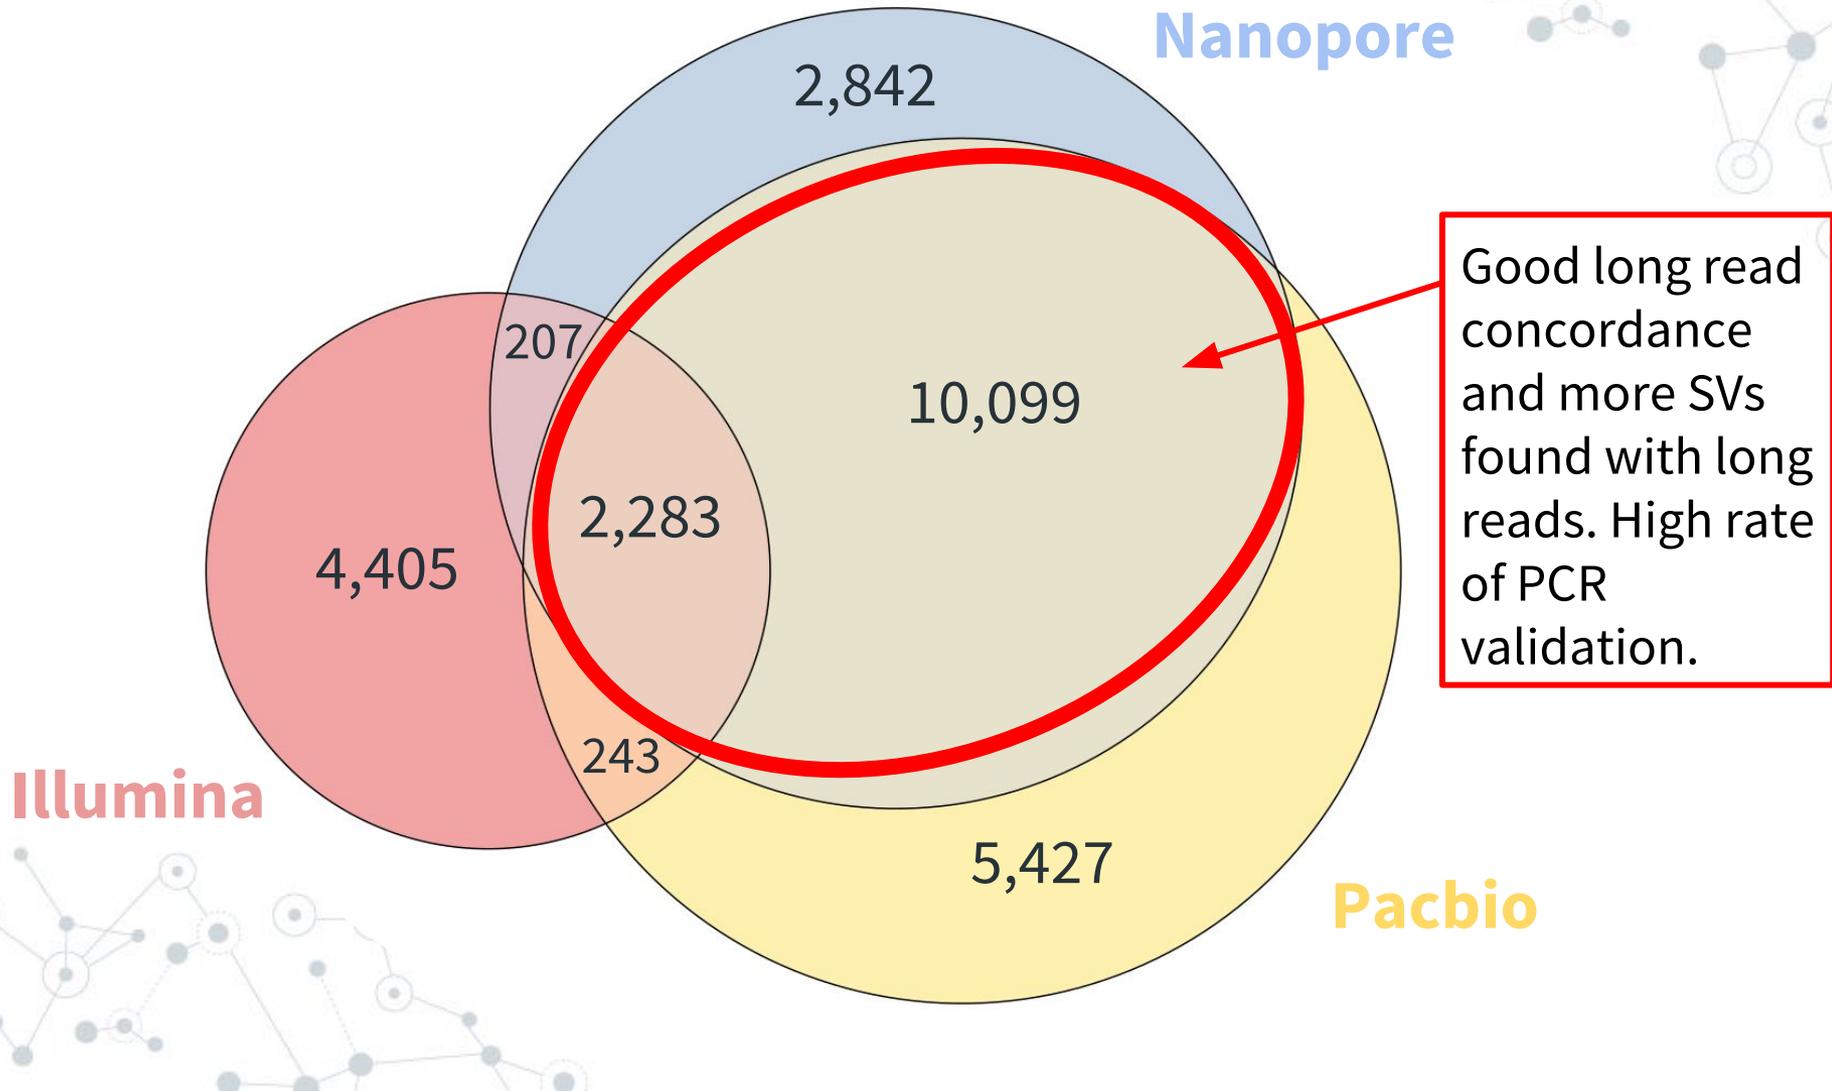

Nearly 20,000 structural variants detected

Mostly missed by short read sequencing

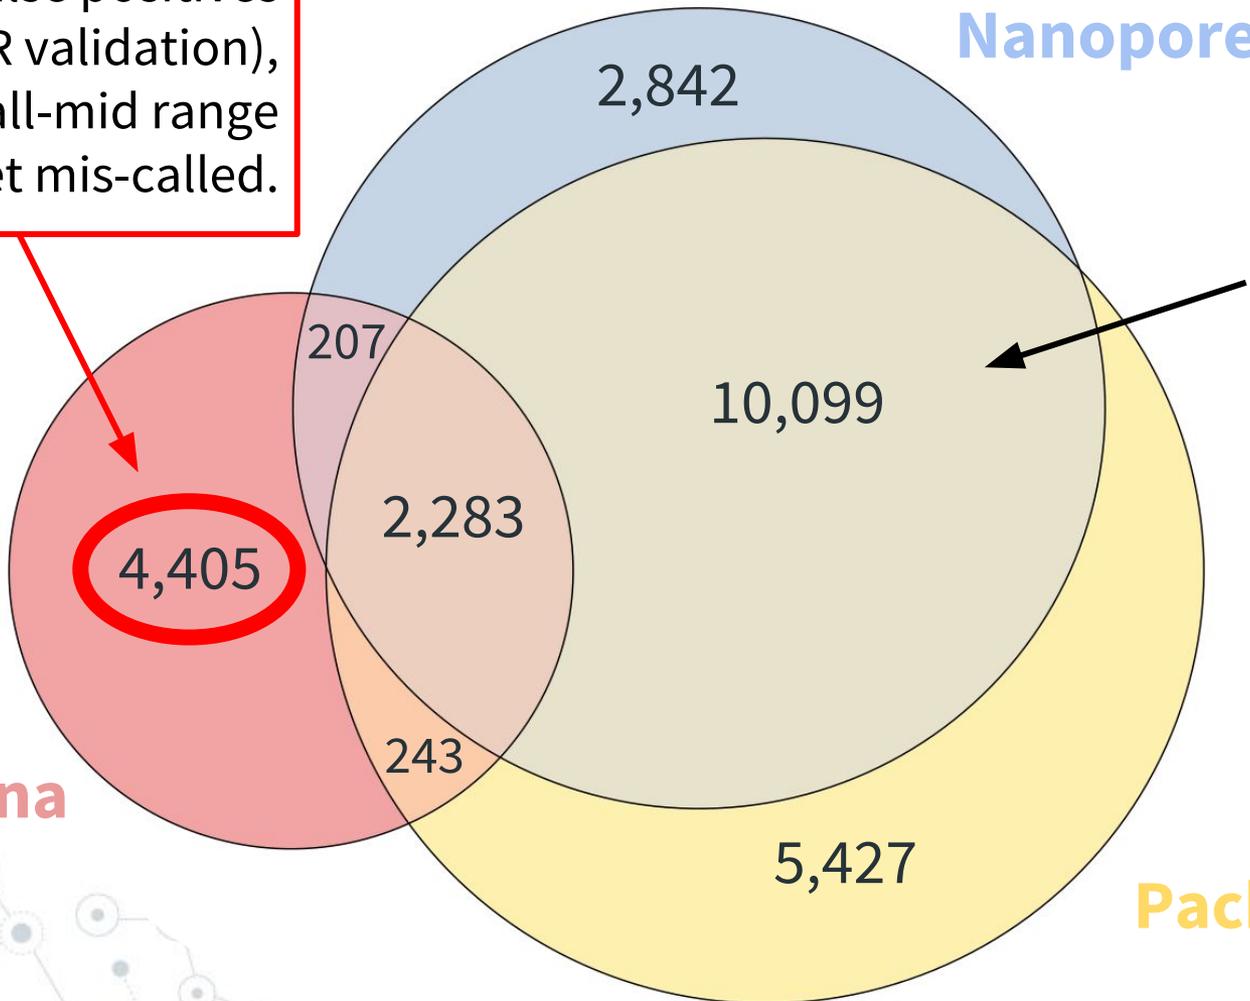

Structural variants detected with PacBio in SKBR3 (Nattestad *et al*, 2018).

# Variant calling across platforms

# Variant calling across platforms

Mostly false positives  
(PCR validation),  
often small-mid range  
indels get mis-called.

Nanopore

Good long read  
concordance  
and more SVs  
found with long  
reads. High rate  
of PCR  
validation.

Illumina

Pacbio

# Conclusions and future directions

## Long reads are critical to variant discovery!

*Long term:* Work towards collecting long read data sets

*Immediate:* Get more out of short read data, given a small collection of long read samples

A decorative background featuring a network diagram with nodes and connections. The nodes are represented by circles of varying sizes and colors (light blue, dark blue, and grey), connected by thin lines. The diagram is positioned in the corners of the page, with a larger, more complex structure in the bottom right and smaller, simpler structures in the top left and middle left.

**Questions?**

# Exonic variant (all cancer, no normal samples)

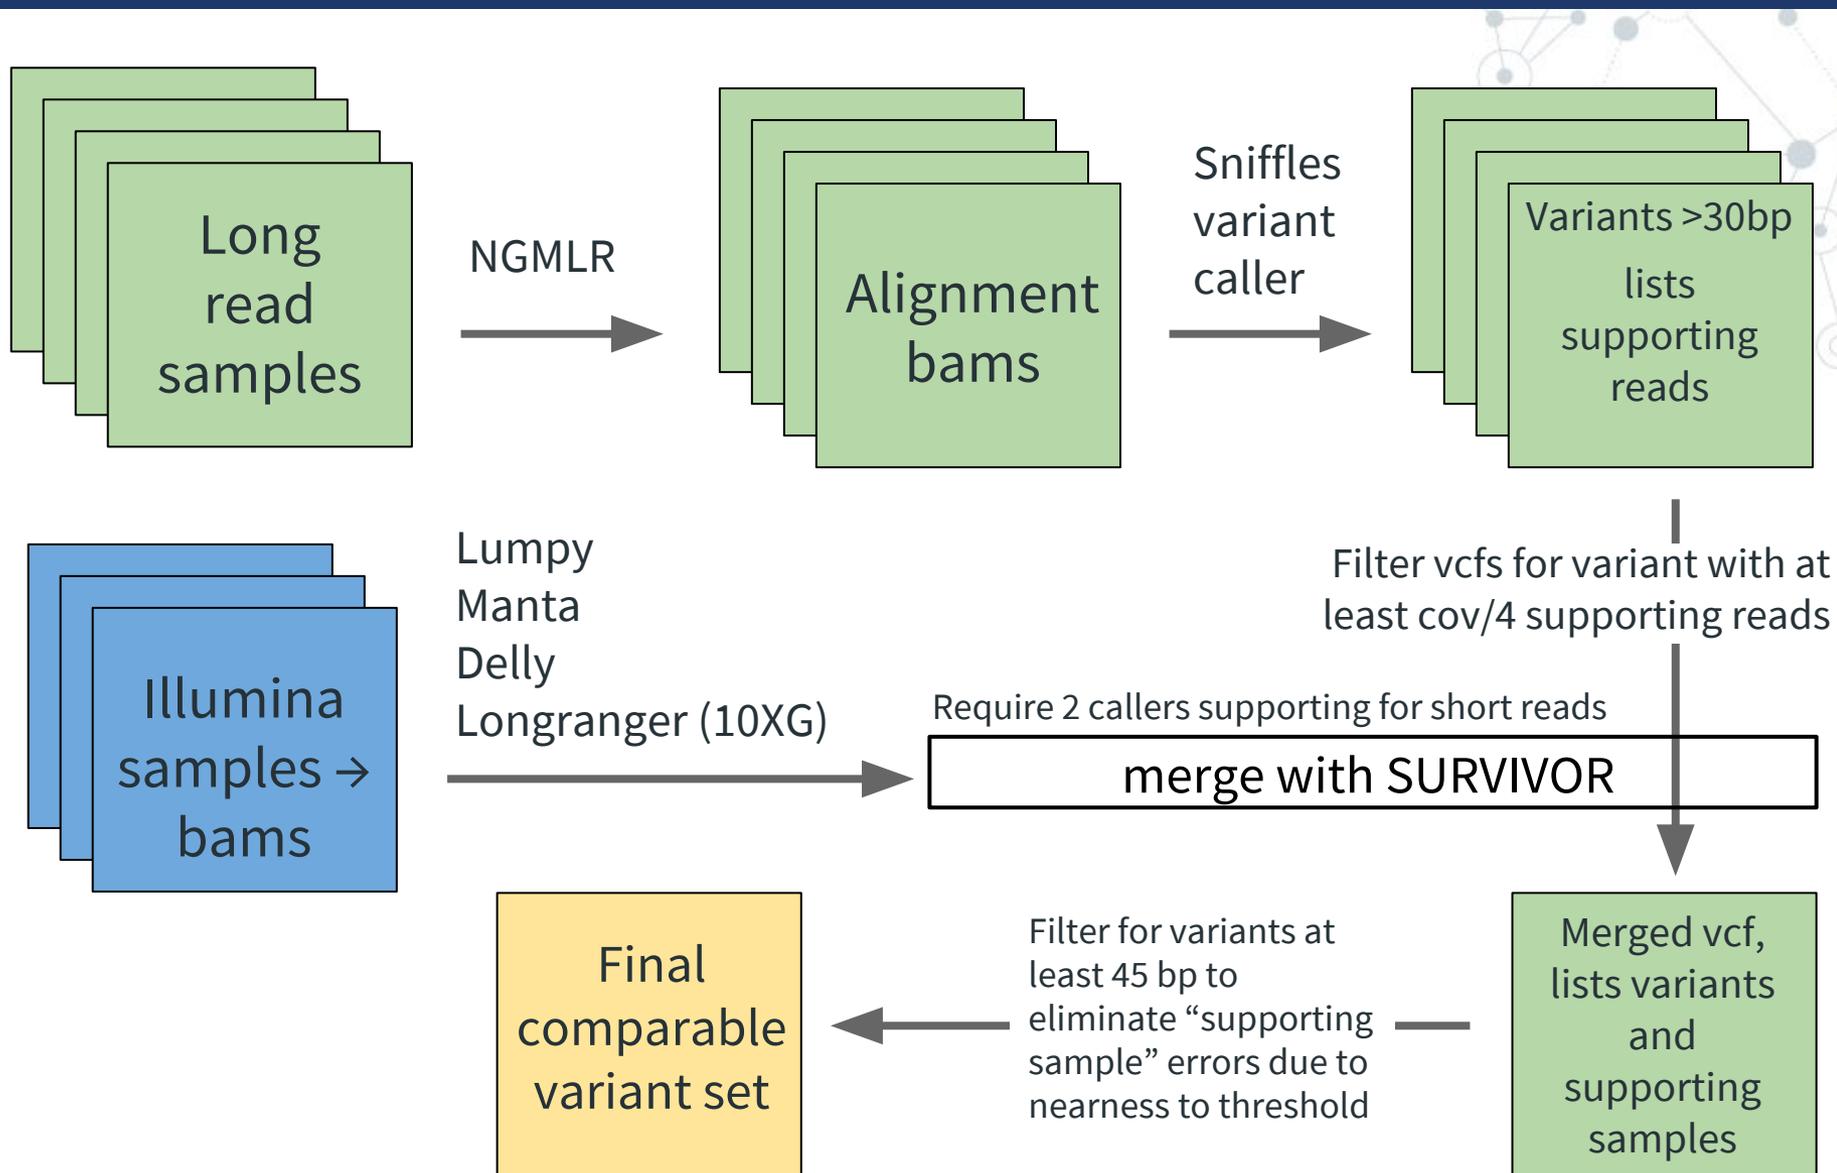

17 kb inversion

Encompasses ncRNA LOC105370449

Just ahead of SNX6, aka TRAF4, a known oncogene

# Protocol for variant comparison

# Data statistics for all samples
